If step 1 is not clear to you, go see LoremIpsum's channel on youtube. He explains it very well.

Instead of doing this manually, you can use "dolorsiamet" its a vscode plugin that sets everything up from a GUI interface. It is very well explained and you are sure not to be missing any steps.

Pretty usefull but some part are hard to understand for new user

8

Kleinefrustuck | 15/01/2022

The set-up and management is easy once you are familiar with it. It's a powerful & flexible tool so it's a good app for people used to AWS service

FuzzBear27 | 20/02/2022 12:23

I don't understand a single things on this page WTF

Kleinefrustuck | 15/01/2022 12:34

It's normal if you never use the AWS service before, you need a time of adaptation to get used to the service

WishLorraine | 14/01/2022

No dude i start using AWS 3 days ago and i found the tutorial super easy

what's a secrets and why did i need it ?

It's basically the key to access your information and projects

30

WishLorraine | 14/01/2022

I don't understand the tutorial someone can help me setup my secrets ?

You have the Loreimpsum's video and if it's necessary search other tutorial on youtube

Troubleshooting

Release notes

Document history

you can access your application server remotely, follow the steps shown in the [Create a secret](#) page in the *AWS Secrets Manager User Guide*. Provide the information that App2Container needs to run remote commands as follows.

Step 1 Choose secret type

- Secret type** – To store a key that App2Container uses programmatically, through API calls, choose the **Other type of secrets** option.
- Specify the following **Key/value pairs** to store in the secret. To add the next key/value pair, choose **+ Add row**.
 - Username key**
 - Key name (box 1):** `username`
 - Key value (box 2):** Enter the plaintext username value to use with SSH.
 - SSH private key**
 - Key name (box 1):** `key`
 - Key value (box 2):** Copy the base64-encoded string that represents your private key file into the second box.

Note

To base64-encode your key file, you can use the following command, where `.ssh/id_rsa` is the private key that encodes the file:

```
$ base64 .ssh/id_rsa
```

SSH Certificate key (optional)

- Key name (box 1):** `cert`
- Key value (box 2):** Copy the base64-encoded string that represents your signed certificate file into the second box.

Note

To base64-encode your signed certificate file, you can use the following command, where `.ssh/id_rsa-cert.pub` is the private key that encodes the file:

```
$ base64 .ssh/id_rsa-cert.pub
```
